

2. Sort Array By Parity

Given an integer array `nums`, move all the even integers at the beginning of the array followed by all the odd integers.

Return *any array that satisfies this condition*.

Example 1:

Input: `nums = [3,1,2,4]`

Output: `[2,4,3,1]`

Explanation: The outputs `[4,2,3,1]`, `[2,4,1,3]`, and `[4,2,1,3]` would also be accepted.

Example 2:

Input: `nums = [0]`

Output: `[0]`

Constraints:

- $1 \leq \text{nums.length} \leq 5000$
- $0 \leq \text{nums}[i] \leq 5000$

PROGRAM

```
class Solution {

    public int[] sortArrayByParity(int[] nums) {

        int left = 0;

        int right = nums.length - 1;

        while (left < right) {

            // Find an odd number from the left
            while (left < right && nums[left] % 2 == 0) {

                left++;

            }

            // Find an even number from the right
            while (left < right && nums[right] % 2 != 0) {

                right--;
```

```
}

// Swap them
if (left < right) {

    int temp = nums[left];

    nums[left] = nums[right];

    nums[right] = temp;

    left++;

    right--;

}

}

return nums;

}

}
```
