

2. Find Pivot Index

Given an array of integers `nums`, calculate the **pivot index** of this array.

The **pivot index** is the index where the sum of all the numbers **strictly** to the left of the index is equal to the sum of all the numbers **strictly** to the index's right.

If the index is on the left edge of the array, then the left sum is 0 because there are no elements to the left.

This also applies to the right edge of the array.

Return *the leftmost pivot index*. If no such index exists, return -1.

Example 1:

Input: `nums = [1,7,3,6,5,6]`

Output: 3

Explanation:

The pivot index is 3.

Left sum = `nums[0] + nums[1] + nums[2] = 1 + 7 + 3 = 11`

Right sum = `nums[4] + nums[5] = 5 + 6 = 11`

Example 2:

Input: `nums = [1,2,3]`

Output: -1

Explanation:

There is no index that satisfies the conditions in the problem statement.

Example 3:

Input: `nums = [2,1,-1]`

Output: 0

Explanation:

The pivot index is 0.

Left sum = 0 (no elements to the left of index 0)

Right sum = `nums[1] + nums[2] = 1 + -1 = 0`

Constraints:

- $1 \leq \text{nums.length} \leq 10^4$
- $-1000 \leq \text{nums}[i] \leq 1000$

PROGRAM

```
class Solution {
```

```
    public int pivotIndex(int[] nums) {
```

```
        int totalSum = 0;
```

```
        // Calculate total sum
```

```
        for (int num : nums) {
```

```
        totalSum += num;
    }

    int leftSum = 0;

    // Check every index
    for (int i = 0; i < nums.length; i++) {

        // Right sum = total - left - current
        int rightSum = totalSum - leftSum - nums[i];

        if (leftSum == rightSum) {
            return i;
        }

        leftSum += nums[i];
    }

    return -1;
}
```
