

2. Java Comparator

Comparators are used to compare two objects. In this challenge, you'll create a comparator and use it to sort an array.

The *Player* class is provided for you in your editor. It has fields: a String and a integer.

Given an array of *Player* objects, write a comparator that sorts them in order of decreasing score; if or more players have the same score, sort those players alphabetically by name. To do this, you must create a *Checker* class that implements the *Comparator* interface, then write an *int compare(Player a, Player b)* method implementing the [Comparator.compare\(T o1, T o2\)](#) method.

Input Format

Input from stdin is handled by the locked stub code in the *Solution* class.

The first line contains an integer, *n*, denoting the number of players.

Each of the subsequent lines contains a player's name and *s*, respectively.

Constraints

- players can have the same name.
- Player names consist of lowercase English letters.

Output Format

You are not responsible for printing any output to stdout. The locked stub code in *Solution* will create a *Checker* object, use it to sort the *Player* array, and print each sorted element.

Sample Input

PROGRAM

```
import java.util.*;

class Checker implements Comparator<Player> {

    @Override

    public int compare(Player a, Player b) {

        // Higher score comes first

        if (a.score != b.score) {

            return b.score - a.score;

        }

        // If scores are equal, sort names alphabetically

        return a.name.compareTo(b.name);

    }

}

class Player{

    String name;

    int score;
```

```

Player(String name, int score){

    this.name = name;

    this.score = score;

}

}

class Solution {

    public static void main(String[] args) {

        Scanner scan = new Scanner(System.in);

        int n = scan.nextInt();

        Player[] player = new Player[n];

        Checker checker = new Checker();

        for(int i = 0; i < n; i++){

player[i] = new Player(scan.next(), scan.nextInt());

        }

        scan.close();

        Arrays.sort(player, checker);

        for(int i = 0; i < player.length; i++){

            System.out.printf("%s %s\n", player[i].name, player[i].score);

        }

    }

}

```
